DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).

### DNA - Wikipedia

6.1 Introduction. DNA analysis is, after immunofluorescence, the second most important application of flow cytometry. By measuring the DNA content of individual cells, we obtain information about their ploidy (see Section 6.3), of particular relevance in tumours, and, for a population, the distribution of cells across the cell cycle. The relationship between the DNA histogram and the cell cycle ...

The RNA world is a hypothetical stage in the evolutionary history of life on Earth, in which self-replicating RNA molecules proliferated before the evolution of DNA and proteins. The term also refers to the hypothesis that posits the existence of this stage. Alexander Rich first proposed the concept of the RNA world in 1962, and Walter Gilbert coined the term in 1986.

Paige A. Bommarito, Rebecca C. Fry, in Toxic epigenetics, 2019 Chapter Overview. DNA methylation represents the best characterized form of epigenetic modification. DNA methylation is written onto the genome by two methyltransferases, known as Dnmt3a and Dnmt3b. These enzymes catalyze the addition of a methyl group to the fifth carbon of the cytosine DNA base.
