How does LCA work? LCA supposes a simple parametric model and uses observed data to estimate parameter values for the model. The model parameters are: (1) the prevalence of each of C case subpopulations or latent classes (they are called 'latent' because a case's class membership is not directly observed); and (2) conditional response probabilities--i.e., the probabilities, for each ...

Rule 1: Non-zero digits are always significant. Hopefully, this rule seems rather obvious. If you measure something and the device you use (ruler, thermometer, triple-beam balance, etc.) returns a number to you, then you have made a measurement decision and that ACT of measuring gives significance to that particular numeral (or digit) in the overall value you obtain.

A regular polygon is an n-sided polygon in which the sides are all the same length and are symmetrically placed about a common center (i.e., the polygon is both equiangular and equilateral). Only certain regular polygons are "constructible" using the classical Greek tools of the compass and straightedge. The terms equilateral triangle and square refer to the regular 3- and 4-polygons ...
